SEMICARBAZONES HAVING CNS ACTIVITY  
AND PHARMACEUTICAL PREPARATIONS CONTAINING SAME

TECHNICAL FIELD

This invention relates to semicarbazone compounds having central nervous system (CNS) activity and to pharmaceutical preparations containing such compounds.

- 5 More particularly, the invention relates to semicarbazones having anticonvulsant properties and to the use of such semicarbazones for the treatment or prevention of convulsions and seizures in humans and animals.

10 BACKGROUND ART

There has been a great deal of interest for many years in the identification of drugs that exhibit central nervous system activity in humans and animals and that are, in particular, anticonvulsants used for the treatment or prevention of epileptic seizures and other central nervous system disorders.

15 A previous study carried out by one of the inventors of the present invention (Dimmock et al., J. Med. Chem., 1993, 36, pp. 2243-2252) revealed that a number of aryl semicarbazones of the general formula A

20 25 possess anticonvulsant activity in the maximal electroshock (MES) screen and the subcutaneous pentylenetetrazole (scPTZ) screen when administered by the intraperitoneal route to mice. These screens are test systems developed to detect compounds which will afford protection to generalized tonic-clonic seizures and generalized absence convulsions, respectively. The

MES screen and the scPTZ screen have been discussed by Krall, et al. in "Antiepileptic drug development:II. Anticonvulsant drug screening", *Epilepsia*, 1978, 19, pp. 409-428; the disclosure of which is incorporated herein by reference.

Nevertheless, the compounds of formula A displayed neurotoxicity when administered by this route and the protection indices (PI, namely the ratio  $TD_{50}/ED_{50}$ ) of ten representative compounds were low.

There is accordingly a need for compounds showing much improved anticonvulsive effects with reduced toxicity.

#### DISCLOSURE OF THE INVENTION

An object of the invention is to provide compounds having central nervous system activity.

Another object of the invention is to provide pharmaceutical compositions that have good anti-convulsive activity and acceptable neurotoxicity.

Yet another object of the invention is to provide methods of treating convulsions in humans and animal patients without producing unacceptable side effects.

According to one aspect of the invention, there is provided a compound of the general formula I

wherein: R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup> and R<sup>4</sup> may be the same or different and each represents a hydrogen or halogen atom, or a C<sub>1-9</sub>alkyl, C<sub>5-12</sub>cycloaliphatic, cyano, C<sub>1-9</sub>alkoxy or C<sub>6-10</sub>aryloxy group; R<sup>5</sup> represents a hydrogen atom or a C<sub>1-9</sub>alkyl, C<sub>3-12</sub>cycloalkyl or C<sub>6-10</sub>aryl group; and X is oxygen or sulfur. In the compounds of the invention,

the alkyl substituents, when present, may be straight-chained or branched.

It should be noted, however, that the compound of Formula I above in which R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup>, R<sup>4</sup> and R<sup>5</sup> are all hydrogen is known from Tomita et. al., "Synthesis of Aldehyde Derivatives Containing a Diphenyl Ether Nucleus", J.Pharm.Soc.Japan, 1955, 75, 1021-1023, but this reference does not disclose the anticonvulsive property of the compound.

According to another aspect of the invention, there is provided a composition comprising a compound of general formula I and a pharmaceutically acceptable diluent, excipient or carrier.

According to yet another aspect of the invention, there is provided a method of treating diseases of the central nervous system of a human or animal patient, which comprises administering to said patient an effective amount of a compound of general formula I.

The compounds of the invention may be administered orally and may exhibit very high potencies against CNS convulsions, e.g. they may possess ED<sub>50</sub> figures (for the maximal electroshock screen in rats) in the 1-5 mg/kg range (more usually the 2-3 mg/kg range) while exhibiting an absence of neurotoxicity at the maximum dose utilized (e.g. 500 mg/kg), thus leading to extremely favourable protection index (PI) values.

The compounds of the invention appear to act by one or more mechanisms which are different from those of conventional anticonvulsant drugs. Moreover, the compounds of the invention may be free from some of the disadvantages of conventional anticonvulsant drugs since proconvulsant properties and effects on the activities of certain hepatic enzymes are absent in at least some of the compounds of the invention.

#### BRIEF DESCRIPTION OF THE DRAWINGS

Figure 1 is a simplified representation of the postulated receptor site showing different binding regions for the compounds according to the present invention:

Figure 2 shows basic skeletal structures to indicate the compounds listed in Tables 1 to 3; and

Figure 3 shows basic chemical structures to indicate the compounds listed in Tables 4 to 6.

#### 10 BEST MODES FOR CARRYING OUT THE INVENTION

## METHODS OF SYNTHESIS

The compounds of the present invention and compounds having related structures can be synthesized by various chemical routes, e.g. by a modification of a method disclosed by Yeager et al. ("A Convenient Method for the Preparation of 4-Aryloxyphenols", *Synthesis*, 1991, pp. 63-68; the disclosure of which is incorporated herein by reference). Yeager et al. describes a process for producing aryloxybenzaldehydes or aryloxaryl ketones. These intermediates may then be reacted with semicarbazides. This route is illustrated by the reaction scheme below:

The reaction scheme shown above requires the formation of intermediate aryloxy- or arylthio-benzaldehydes or ketones by reacting appropriate phenols or thiophenols with fluorobenzaldehyde or fluoroaryl 5 ketones in a suitable solvent (e.g. dimethylacetamide) in the presence of anhydrous potassium carbonate at temperatures in the range of 100 to 200°C under atmospheric pressure of a non-oxidizing gas (e.g. nitrogen) with reflux for a period of about 5-10 hours.

10 After cooling and water addition, the intermediate compound may be extracted with an organic solvent (e.g. chloroform) and dried. The intermediate aryloxy(thio)benzaldehydes aryloxy(thio)aryl ketones are then converted into the desired semicarbazones by 15 reaction with semicarbazide in an aqueous ethanolic solution for a period of one to several hours at ambient temperature, and the resulting precipitate of the final product is then collected and recrystallized. The starting materials, which are generally reacted in 20 approximately stoichiometrical amounts, are themselves commercially available products and can, in particular, be obtained from the Aldrich Chemical Company, Milwaukee, USA.

STRUCTURES

25 Without wishing the invention to be limited to a particular theory, it is believed that the compounds of the present invention exert their anticonvulsive activity by aligning their molecules at a postulated receptor site in the human or animal brain, and it is 30 theorized that such interactions take place at three areas of the receptor, namely an aryl binding site, a hydrogen bonding area and a distal binding site as illustrated in Fig. 1.

These sites are believed to react with the proximal 35 aryl ring (the ring next to the semicarbazono group), the semicarbazono ( $\text{H}_2\text{NCONHN=}$ ) group itself and the distal

aryl ring of the compounds, respectively. The presence of the distal aryl ring and certain substituent groups on the distal and, to a lesser extent, the proximal aryl ring in the compounds of the invention appear to 5 strengthen the attachment of the molecule at the receptor and thus increase the potency of the compounds.

A systematic synthesis and evaluation of compounds of Formula I and compounds with closely related structures has revealed the following general principles

10 (i) The substitution of the methine hydrogen attached to the carbimino carbon atom by larger groups does not significantly affect the anticonvulsive activity of the compounds; (ii) positioning of the arlyoxy or arylthio group in the ortho or meta positions 15 of the proximal ring leads to a lowering or abolition of anticonvulsive activity; (iii) the substitution of the ether oxygen by sulfur or sulfonyloxy groups leads to compounds with similar anticonvulsive activities, while other spacers lower the anticonvulsive potencies; (iv) a decrease in size of the substituents on the distal aryl ring, increases anticonvulsive activity; and (v) the 20 anticonvulsive activity is high when at least one of the substituents on the distal alkyl group is in the para position.

25 Hence, compounds of the present invention which are particularly preferred are those in which R<sup>1</sup> and R<sup>2</sup> are hydrogen or halogen (most preferably fluorine), R<sup>3</sup>, R<sup>4</sup> are each hydrogen and R<sup>5</sup> is hydrogen or C<sub>1-3</sub> alkyl, and X is O or S (and most preferably O).

30 Particularly preferred compounds according to the present invention are 4-(4'-fluorophenoxy)benzaldehyde semicarbazone and 4-(thiophenoxy)benzaldehyde semicarbazone. These compounds exhibit high activity in the MES screen, low toxicity and afford protection in 35 the corneal kindled rat screen without negative features, such as proconvulsant properties.

Incidentally, the kindled rat screen is described by R.J. Racine in "Modification of Seizure Activity by Electrical Stimulation. II. Motor Seizure", *Electroencephalogr.Clin.Neurophysiol.*, 1972, 32, 281-294, and by G. Skeen et al. In "Development of Kindled Seizures Following Electrical Stimulation via the Cornea", *Soc.Neurosci.*, 1990, 16(1), 307; the disclosures of which are incorporated herein by reference.

10 **PHYSIOLOGICAL ACTIVITY**

The compounds of the present invention may in some cases have quite high neurotoxicity when injected intraperitoneally in mice. For example, neurotoxicity was found to be present in approximately 65% of the 15 compounds tested and quantitation of the bioactivities of the compounds of the invention has revealed PI's in the range of 2-14 in the MES screen and 1-3 in the scPTZ screen. However, it has been found that such neurotoxicity disappears or is reduced to an acceptable level when the compounds are administered orally to rats. Moreover, while the compounds exhibit high activity in both the MES screen and the scPTZ screen when administered intra-peritoneally, the activity in the MES screen remains high when the compounds are 20 administered orally, but the activity in the scPTZ screen may decline. For example, for the compound 4-(4'-fluorophenoxy)benzaldehyde semicarbazone, oral dosing of rats produced an ED<sub>50</sub> figure in the rat oral screen of 1.59 mg/kg and a PI of greater than 315. 25 However, the compound did not afford protection in the scPTZ screen at a dose of 125 mg/kg and only 10% of the rats were protected at a dose of 250 mg/kg. An absence of neurotoxicity at the maximum dose utilized (500 mg/kg) led to exceptionally high protection indices.

ADMINISTRATION

The compounds of the invention may be administered orally to humans, preferably at dosages of 50-75 mg/kg, generally in the form of compositions with inert pharmaceutical-acceptable compounds, for example diluents (e.g. calcium phosphate dihydrate, calcium sulfate dihydrate, cellulose, dextrose, lactose, mannitol, starch, sorbitol, sucrose and sucrose-based materials), binders and adhesives (e.g. acacia, cellulose derivatives, gelatin, glucose, polyvinylpyrrolidone (PVP), alginates, sorbitol, pregelatinized starch or starch paste and tragacanth), disintegrants (e.g. alginates, cellulose and cellulose derivatives, clays, cross-linked PVP, starch and starch derivatives), lubricants (e.g. polyethylene glycols, stearic acids, salts and derivatives, surfactants, talc and waxes), glidants (cornstarch, silica derivatives and talc), and colors, flavors and sweeteners (e.g. FD&C and D&C dyes and lakes, flavor oils and spray-dried flavors, artificial sweeteners and natural sweeteners).

The compositions may be prepared in any one of the conventional forms for oral administration, e.g. powders, capsules, tablets, caplets, lozenges, solutions, syrups, etc.

The invention is described in more detail in the following Examples, which are nevertheless not intended to limit the scope of the invention.

EXAMPLE 1

The compounds 2a to 5v shown in Table 1 below were synthesized by the method previously mentioned. The structures of the listed compounds correspond to those shown in Fig. 2 identified by the same first number (2, 3, 4 or 5), with only the substituents being identified in Table 1.

\* Doses of 30, 100 and 300 mg/kg were administered. The figures in the table indicate the minimum dose whereby bioactivity was demonstrated in half or more of the mice. The animals were examined 0.5 h and 4 h after injections were made.

The lines -- indicate an absence of anticonvulsant activity and neurotoxicity.

<sup>b</sup> The figures in the screen indicate the number of rats out of 4 which were protected. The lines -- mean that no activity was demonstrated and the designation - indicates that the compound was not screened.

The details of the syntheses of the various compounds are indicated below.

#### SYNTHESIS OF INTERMEDIATES

5      The 3-phenoxybenzaldehyde used as a starting material required in the synthesis of compound 3 was obtained from the Aldrich Chemical Company, Milwaukee, WI. The intermediate aryloxyaryl and arylthioaryl aldehydes required in the synthesis of the other compounds were prepared as follows.

10     Anhydrous potassium carbonate (0.12M) was added to a solution of the appropriate phenol or thiophenol (0.15M) and 4-fluorobenzaldehyde, 4-fluoroacetophenone or 4-fluoropropiophenone (0.14M) in dimethylacetamide (100mL). The mixture was heated under reflux at 155°C  
15     under nitrogen and the progress was monitored by thin layer chromatography (TLC) using a solvent system of benzene:methanol (9:1 by volume). After approximately 5-10 hours, the mixture was cooled and water (100mL) was added. The reaction mixture was extracted with  
20     chloroform (2x100mL) and the combined organic extracts were washed with aqueous sodium hydroxide solution (4% w/v) and water. After drying over anhydrous magnesium sulfate, the solvent was removed in vacuo and the resultant oil was distilled under reduced pressure to  
25     give the appropriate aryloxyaryl, arylthioaryl aldehyde or ketone. The purity of the distillate was checked by thin layer chromatography (TLC) using benzene:methanol (9:1 by volume) as the solvent. The <sup>1</sup>H NMR spectrum of a representative intermediate, namely 4-phenoxybenz-aldehyde, was as follows: δ(CDCl<sub>3</sub>): 9.94(s,1H,CHO),  
30     7.82-7.88 (2t,2H,ortho H of proximal aryl ring),  
7.38-7.46 (3t,2H,meta H of proximal aryl ring),  
7.20-7.27(3t,1H,para H of distal aryl ring), 7.03-7.12 (3t,4H,ortho and meta H of distal aryl ring).

## SYNTHESIS OF FINAL COMPOUNDS

A mixture of semicarbazide hydrochloride (0.01M), sodium acetate (0.01M) and water (10mL) was added slowly to a stirring solution of the aryloxyaryl or 5 arylthioaryl aldehyde (0.01M) in ethanol (95%, 30mL). The reaction mixture was stirred at room temperature for 1-2 hours, the precipitate was collected, washed with ether, dried and recrystallized from 95% ethanol (compounds 3, 4b, 4e, 4h, 5b-3, 5k-e, 5v), absolute 10 ethanol (compounds 4a, 4c, 4d, 4g, 4i, 5a, 5f-1, 5u) or methanol (compound 4f). The literature melting point (°C) of compound 4a was 219-220°C.

The melting points indicated for the various compounds are uncorrected. Elemental analyses (C,H,N) 15 are within 0.4% of the calculated values except for compound 5n (calcd. for C<sub>12</sub>H<sub>15</sub>N<sub>3</sub>O<sub>2</sub>:N, 15.60. Found: N, 14.80). <sup>1</sup>H NMR spectroscopy was undertaken using a BRUKER AM 300 FT (trademark) NMR instrument. Thin layer chromatography (TLC) was performed using silica gel sheets with a fluorescent indicator.

SYNTHESIS OF COMPOUNDS OF TYPE 15 OF FIGURE 3

3-Benzylxybenzaldehyde required in the synthesis of the unsubstituted compound was obtained from the Aldrich Chemical Company, Milwaukee, WI. The other 20 intermediate aldehydes were prepared as follows.

Benzoyl chloride or 4-chlorobenzoyl chloride (0.05M) was added to a solution of 4-hydroxybenzaldehyde (0.04M) in pyridine (100mL). After standing overnight at room temperature, the reaction mixture was poured 25 onto acetic acid (2N, 100mL). The precipitate was collected, washed with water and recrystallized from water-methanol to give 4-benzoyloxybenzaldehyde and 4-(4-chlorobenzoyloxy)benzaldehyde required in the synthesis of 68 and 69 respectively. 4-Phenylsulfonylbenzaldehyde used in the synthesis of 70 was prepared as 30 follows. A mixture of sodium benzenesulfinate (0.11M)

and 4-fluorobenzaldehyde (0.1M) in dry dimethylsulfoxide (75mL) was stirred at 100°C for 18h under nitrogen and then poured onto ice (~200g). The precipitate was collected, washed with water and recrystallized from ethanol (95% v/v). Finally, benzenesulfonyl chloride or 4-methylbenzesulfonyl chloride (0.20M) was added dropwise to a stirred solution of 4-hydroxybenzaldehyde (0.16M) in dichloromethane (90mL) and triethylamine (3-5mL) at 0 to 10°C over a period of 10 min. After a further 15 min., the reaction mixture was diluted with dichloromethane and successively extracted with water, hydrochloric acid (10% w/v), saturated sodium bicarbonate solution and saturated sodium chloride solution. After drying the organic extract, the solvent was removed affording the intermediate products required for further syntheses. The compounds were homogenous by TLC using a solvent system of benzene:methanol (7:3) and the melting points were in accord with literature values.

These intermediate aldehydes were reacted with semicarbazide as described previously.

SYNTHESIS OF COMPOUNDS OF TYPES 17 AND 18 OF FIGURE 3

These compounds were prepared from the appropriate aryloxyaryl and arylthioaryl aldehydes using literature methodologies (Dimmock, J.R.; McColl, J.M.; Wonko, S.L.; Thayer, R.S.; Hancock, D.S. Evaluation of the thiosemicarbazones of some aryl alkyl ketones and related compounds for anticonvulsant activities. *Eur. J. Med. Chem.* 1991, **26**, 529-534; and Dimmock, J.R.; Puthucode, R.N.; Lo, M.S.; Quail, J.W.; Yang, J.; Stables, J.P. Structural modifications of the primary amino group of anticonvulsant aryl semicarbazones. *Pharmazie*, 1996, **51**, 83-88.). The time of heating the reactants under reflux was six hours, while the times of stirring the reactants at room temperature were eight, ten and fourteen hours. In one case, the reaction

mixture was heated at 60°C for 0.5 hours. All compounds of this type were recrystallized from ethanol (95% v/v)

DETERMINATION OF LOG P VALUES

The log P' figures were determined by a previously reported procedure (Dimmock, J.R.; Phillips, O.A.; Wonko, S.L.; Hickie, R.A.; Tuer, R.G.; Ambrose, S.J.; Reid, R.S.; Mutus, B.; Talpas, C.J. Evaluation of some Mannich bases of conjugated styryl ketones and related compounds versus the WiDr colon cancer in vitro. *Eur. J. Med. Chem.* 1989, 24, 217-226.) except that solutions were made using 1-octanol to which buffer was added. The  $\lambda_{max}$  and  $\epsilon$  values of the compounds were obtained in 1-octanol and not phosphate buffered saline, pH 7.4 due to the low aqueous solubilities of the compounds.

15 EXAMPLE 2

An initial anticonvulsant evaluation of the compounds prepared according to Example 1 was undertaken by administering the compounds by the intraperitoneal route to mice. Protection and/or neurotoxicity was noted 0.5 and 4 hours after administering doses of 30, 20 100 and 300 mg/kg of each semicarbazone to the animals. These results are presented in Table 1 above.

All of the compounds were active in the MES screen except compounds 2a,b,5t,v and protection was afforded by 60% of the compounds in the scPTZ test. Neurotoxicity was displayed by approximately 70% of the semicarbazones. Bioactivity was quantitated for selected compounds and these data are given in Table 2 below:

**Table 2.** Evaluation of Selected Compounds in the MES, scPTZ and Neurotoxicity Screens after Intraperitoneal Injection in Mice

The majority of the compounds were examined for oral activity in rats. Initially doses of 50 mg/kg of the semicarbazones were administered. However as the data in Table 1 reveal, with the exception of compound 5 3, all compounds examined at this dose displayed activity in the MES screen. In an attempt to discern those compounds possessing marked oral activity, the dose was reduced fourfold to 12.5 mg/kg, revealing that protection in the MES screen was retained in all cases.

10 Using the doses indicated in Table 1, neurotoxicity was absent during the 0.25-4 hour time period with the exception of compound 51 in which case 1/4 rats caused neurological deficit 1,2 and 4 hours after oral administration. Compounds 4e,5b,d,g,i,n,q,r were

15 evaluated in the scPTZ screen at the doses indicated in Table 1 but they were either inactive (compounds 5b,d,g,i,g) or displayed only marginal activity, details of which are given below. Quantitation of selected compounds was undertaken and the figures obtained are

20 presented in Table 3.

Table 3. Evaluation of Selected Compounds in the MES and Neurotoxicity Tests after Oral Administration to Rats

\* PI indicates the protection index i.e. TD<sub>50</sub>/ED<sub>50</sub>.

<sup>b</sup> The compound was examined 0.25, 0.5, 1, 3, 4, 6, 8, and 24 h after administration.

Further bioevaluations of compound 4b were undertaken. After intraperitoneal injection into rats, the ED<sub>50</sub> and TD<sub>50</sub> figures in the MES and neurotoxicity screens for 4b were 2.37 and 80.09 mg/kg respectively 5 revealing a PI of 33.8. Using a kindled rat screen, the ED<sub>50</sub> figure of this compound was 3.93 mg/kg. A daily dose of 100 mg/kg of 4b was administered orally for three days to rats. Afterwards, the livers were removed 10 and comparisons made between the hepatic tissue from treated and control animals, namely liver weights and microsomal protein yields in addition to the enzyme activities of cytochrome P450, p-nitroanisole O-demethylase, UDP-glucuronosyl transferase, sulfotransferase, ethoxyresorfin O-deethylase, 15 pentoxyresorfin O-dealkylase, glutathione S-transferase and quinone reductase. No differences in the properties between the livers from treated and control livers were detected ( $p > 0.05$ ).

Both 4b and 5g were examined for proconvulsant 20 properties in the intravenous pentylenetetrazole test in mice; the doses administered were the MES ED<sub>50</sub> and the TD<sub>50</sub> figures of 4b and 5g indicated in Table 2. Neither compound possessed this undesirable feature and using a dose of 108 mg/kg, 4b increased the time to clonus. 25 Compounds 4b and 5g were also evaluated for their ability to prevent convulsions induced by the subcutaneous administration of bicuculline and picrotoxin in mice. The semicarbazone 4b gave partial protection in these two screens whereas 5g was inactive. 30 In addition 4b afforded no protection in the subcutaneous strychnine test in mice.

Full details of these tests are provided below  
INTRAPERITONEAL INJECTION IN MICE

In addition to the information summarized in Table 35 1, intraperitoneal injection of a number of compounds into mice elicited the following side effects at various

doses (mg/kg) and time intervals. First, in the scPTZ screen, myoclonic jerks were noted with the following compounds namely 4c:30,100;0.5h and 5f: 100,300;0.5h. Second continuous seizure activity was observed in the 5 scPTZ screen as follows: 4c:300;0.5h; 100,300;4h; 4d:100,300;0.5 and 4h; 4i:100,300;0.5 and 4h; 5i:300;0.5h; 5l:300,0.5 and 4h; 5o:100,300;0.5h and 5g:300;4h. At the end of the 4 hours, continuous seizure activity followed by death resulted in the scPTZ screen when mice received 10 300 mg/kg of 5o.

#### ORAL ADMINISTRATION TO RATS

Using the doses indicated in Table 1, several compounds showed marginal activity in the scPTZ screen. These compounds as well as the number of rats protected 15 at different time periods are as follows: 4e:1/4 after 0.5,1,4h; 5h:1/4 after 4h; 5n:1/4 after 0.5,1,2h and 5x: 1/4 after 1,4h and 2/4 after 2 hours.

#### INTRAPERITONEAL INJECTION OF COMPOUND 4b IN RATS

The ED<sub>50</sub> figures, 95% CI values and slope (SE) for 20 4b in the MES screen obtained 4h after intraperitoneal injection into rats were as follows: 2.37, 1.39-3.57 and 2.65(0.76) while the corresponding TD<sub>50</sub> data were 80.09, 66.14-87.27 and 17.02(6.41). The protection afforded after intraperitoneal administration of 125 and 25 250 mg/kg of 4b in the scPTZ screen was displayed in 0/2 and 1/10 rats.

#### KINDLED RAT TEST USING COMPOUND 4b

The kindled rat test was undertaken by reported 30 procedures (as indicated above). Compound 4b was administered orally and the animals challenged with electrical stimuli 2h later. The ED<sub>50</sub> is the dose required to reduce seizures from stage 5 to stage 3 or less and these stages are described as follows namely stage 1 is mouth and facial clonus, stage 2 is stage 1 plus head nodding, stage 3 is stage 2 plus forelimb clonus, stage 4 is stage 3 plus rearing and stage 5 is 35

stage 4 plus repeated rearing and falling. The ED<sub>50</sub> (mg/kg), 95% CI and slope (SE) figures for 4b were as follows: 3.93, 2.40-6.09 and 3.62(1.10). The ED<sub>50</sub> data (mg/kg, 95% CI in parentheses) and times of the test for three reference drugs were as follows: phenytoin: >100, 0.25 h; carbamazepine: 28.90 (7.72-75.59), 1h and valproate: 117.41(67.98-189.02), 0.25h.

5           EFFECT OF CHRONIC ORAL ADMINISTRATION OF 4b ON RAT LIVERS

10          Rats were administered 100 mg/kg of 4b daily for 3 days. The livers were removed, weighed and the effect of 4b on the liver microsomal system were compared to control animals which received only the vehicle (sonicated 0.5% methylcellulose).<sup>21-23</sup>

15          (VI) EVALUATION OF 4b AND 5g IN THE TIMED INTRAVENOUS PENTYLENETETRAZOLE TEST.

20          Compounds 4b and 5g in methylcellulose solution (0.5%) were injected intraperitoneally into mice. The two doses used were the approximate ED<sub>50</sub> values in the MES test and the TD<sub>50</sub> figures. After 1h, a solution of pentylenetetrazole (0.5%), sodium chloride and sodium heparin (10 USP units/mL) in water were infused into the tail veins of mice at a rate of 0.37 mL/min (4b) and 0.34 mL/min (5g). The times from the commencement of the 25 infusion until the appearances of the first twitch and also the onset of clonus were recorded for the test and control animals. From these data, the quantities of pentylenetetrazole infused was obtained. Ten animals were used as controls and for each dose administered except for the 13 mg/kg dose of 4b in which case 9 animals were employed. The figures for the times of the first twitch in seconds, quantity of pentylenetetrazole administered in mg/kg (SE) and p values were as follows: 4b(dose of 13 mg/kg): 32.2, 32.3(1.4), >0.05; 4b(dose of 30 108 mg/kg): 32.2, 32.6(0.8), >0.05; 5g(dose of 15 mg/kg): 32.8, 32.9(1.4), >0.05; 5g(dose of 95 mg/kg): 35

34.6, 34.6(1.5), >0.05. The relevant data for the times to clonus in seconds, quantity of pentylenetetrazole administered in mg/kg (SE) and p values were as follows:  
5      4b(dose of 13 mg/kg): 37.6, 37.6(1.5), >0.05; 4b(dose of 108 mg/kg): 41.5, 42.1(1.4), <0.01; 5g(15 mg/kg): 41.2, 41.2(2.6), 0.05; 5g(dose of 95 mg/kg): 44.4, 44.4(2.5), >0.05.

(VII) EVALUATION OF 4b AND 5g USING OTHER CHEMICALLY INDUCED SEIZURE MODELS.

- 10     Various doses of 4b and 5g were administered to mice 1h (4b) or 0.5 h (5g) before chemoconvulsant doses of bicuculline and picrotoxin were given subcutaneously to mice. Compound 4b was also examined for protective effects after subcutaneous administration of strychnine.  
15     In the case of 4b, the number of animals protected in the subcutaneous bicuculline test at different doses (mg/kg) were as follows: 0/8(54), 3/8(108) and 3/8(216). In the subcutaneous picrotoxin test, the protection at various doses (mg/kg) were as follows: 1/8(27),  
20     5/16(108), 2/8(216). Compound 5g showed no effect in the 12-96 mg/kg dose range in these two tests. The semicarbazone 4b afforded no protection in the subcutaneous strychnine test using a dose range of 13.5-108 mg/kg. Two animals per dose were used except in  
25     the bicuculline and picrotoxin tests for 4b in which cases, 8 or 16 animals per dose were employed.

EXAMPLE 3

The compounds having the structures shown in Table 4 were prepared. The structures of the listed compounds correspond to those shown in Fig. 3 identified by the same first number (12, 13, 14, 15, 16, 17 or 18), with only the substituents being identified in Table 4.

\* Doses of 30, 100 and 300 mg/kg were administered. The figures in the table indicate the minimum dose whereby bioactivity was demonstrated in half or more of the mice. The animals were examined 0.5 h and 4 h after injections were made.

The lines -- indicate an absence of anticonvulsant activity and neurotoxicity.

<sup>b</sup> The Figures in the table indicate the number of rats out of 4 which were protected.

The lines -- mean that no activity was demonstrated while the designation - reveals that the compound was not screened.

These compounds were synthesized as follows, although attempts to isolate 2-phenoxypropiophenone, required in the synthesis of compound 4 ( $R^1=C_6H_5$ ;  $R^2=H$ ), were unsuccessful; the reactions invariably leading to 5 the formation of a number of compounds. The intermediate aldehydes and ketones were reacted with semicarbazide (13-16), thiosemicarbazide (17a,c), aminoguanidine (17b,d), formic acid hydrazide (18a,e), acetic hydrazide (18b), carbohydrazide (18c) or oxamic hydrazide (18d).

Initial anticonvulsant evaluation of compounds 13-18 was undertaken as follows. Doses of 30, 100 and 300 mg/kg were injected by the intraperitoneal route into mice and evaluated in the MES, scPTZ and 15 neurotoxicity screens one half and four hours after administration. The results are presented in Table 4 above in addition to the data for 12a-e which is included for comparative purposes.

Quantitation of the activity of selected compounds 20 was undertaken and these results are indicated in Table 5.

Table 5. Quantitation of the Activity of Certain Compounds in the MES, SCPTZ and Neurotoxicity Screens after Intraperitoneal Injection in Mice

<sup>a</sup> The protection index (Pi) is obtained by dividing the TD<sub>50</sub> figures by the ED<sub>50</sub> values.

Evaluation of most of the semicarbazones and analogs in the MES and neurotoxicity tests after oral administration to rats was performed. At the doses indicated in Table 4, neurotoxicity was absent and some 5 of the compounds examined in the scPTZ screen were either inactive or afforded only minimal protection. Hence only the MES data are presented in Table 4. The ED<sub>50</sub> figures of several compounds in the rat oral MES screen are given in Table 6.

\* The letters PI refer to the protection index viz TD<sub>50</sub>/ED<sub>50</sub>.

b Data for this compound were taken from reference 1.

c The compound was examined 0.25, 0.5, 1, 2, 4, 6, 8 and 24 h after administration.

The final pharmacological evaluation of representative compounds was undertaken using an epileptic chicken model.<sup>6</sup> In this case, the convulsions which are induced by intermittent photic stimulations 5 have been shown to be prevented by a number of anticonvulsants at blood levels similar to those used in humans. Two series of compounds were examined with the aim of observing whether oxygen or sulfur is a preferable spacer atom between the two aryl rings and 10 also to compare the ED<sub>50</sub> figures with those obtained in the rat oral and mouse intraperitoneal screens. The ED<sub>50</sub> values of the ethers 12a-d were 1.5, 2.5, 1.0 and 2.0 mg/kg respectively and for the thioethers bearing the same aryl substitution pattern namely 16a,15a,16b,c, the 15 figures were 1.5, 2.5, 1.0 and 1.5 mg/kg respectively. Hence potencies are unaffected by whether oxygen or sulfur are used as the spacer group. The ED<sub>50</sub> values of 12a,15a,16a in the rat oral screen are in the 1-5 mg/kg range whereas for 12a,15a,16b,c the figures in the mouse 20 intraperitoneal test are approximately 15-25 mg/kg. Hence the results from the epileptic chicken model are comparable with the data provided in the rat oral screen.

Claims:

1. A compound characterized by general formula I:

wherein: R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup> and R<sup>4</sup> may be the same or different  
 5 and each represents a hydrogen or halogen atom, or a C<sub>1-10</sub>alkyl, C<sub>1-10</sub>cycloalkyl, cyano, C<sub>1-10</sub>alkoxy or C<sub>6-10</sub>aryloxy group; R<sup>5</sup> represents a hydrogen atom or a C<sub>1-3</sub>alkyl, C<sub>3-10</sub>cycloalanyl or C<sub>6-10</sub>aryl group; and X is oxygen or sulfur; except that R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup>, R<sup>4</sup> and R<sup>5</sup> may not all be  
 10 hydrogen; or a pharmaceutically-acceptable salt thereof.

2. A compound according to claim 1 characterized in that R<sup>1</sup> and R<sup>2</sup> may be the same or different and each represents hydrogen or halide, R<sup>3</sup> and R<sup>4</sup> are each hydrogen, R<sup>5</sup> is hydrogen or C<sub>1-3</sub>alkyl, and X is O or S.

15 3. A compound according to claim 1 characterized in that R<sup>1</sup> and R<sup>2</sup> represent hydrogen or fluorine, R<sup>5</sup> is hydrogen and X represents oxygen.

4. 4-(4'-Fluorophenoxy)benzaldehyde semicarbazone or a pharmaceutically-acceptable salt thereof.

20 5. 4-(Thiophenoxy)benzaldehyde semicarbazone or a pharmaceutically-acceptable salt thereof.

6. A composition for treatment of diseases of the central nervous system, characterized in that said composition contains a compound of general formula I:

5 wherein:  $\text{R}^1$ ,  $\text{R}^2$ ,  $\text{R}^3$  and  $\text{R}^4$  may be the same or different and each represents a hydrogen or halogen atom, or a  $\text{C}_{1-5}$ alkyl,  $\text{C}_{1-5}$ cycloalkyl, cyano,  $\text{C}_{1-5}$ alkoxy or  $\text{C}_{6-10}$ aryloxy group;  $\text{R}^5$  represents a hydrogen atom or a  $\text{C}_{1-5}$ alkyl,  $\text{C}_{3-5}$ cycloalkyl or  $\text{C}_{6-10}$ aryl group; and  $\text{X}$  is oxygen or  
10 sulfur; or a pharmaceutically-acceptable salt thereof;  
15 and a pharmaceutically-acceptable excipient.

7. A composition according to claim 6 characterized in that  $\text{R}^1$  and  $\text{R}^2$  may be the same or different and each represents hydrogen or halide,  $\text{R}^3$  and  $\text{R}^4$  are each hydrogen,  $\text{R}^5$  is hydrogen or  $\text{C}_{1-5}$ alkyl, and  $\text{X}$  is O or S.

8. A composition according to claim 6 characterized in that  $\text{R}^1$  and  $\text{R}^2$  represent hydrogen or fluorine,  $\text{R}^5$  is hydrogen and  $\text{X}$  represents oxygen.

9. A composition according to claim 6 characterized in that said compound is 4-(4'-fluorophenoxy)benzaldehyde semicarbazone or a pharmaceutically-acceptable salt thereof.

20 10. A composition according to claim 6 characterized in that said compound is 4-(thiophenoxy)benzaldehyde semicarbazone or a pharmaceutically acceptable salt thereof.

11. A method of preparing a compound of general formula I:

wherein: R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup> and R<sup>4</sup> may be the same or different  
 5 and each represents a hydrogen or halogen atom, or a C<sub>1</sub>-alkyl, C<sub>3</sub>-cycloalkyl, cyano, C<sub>1</sub>-alkoxy or C<sub>6-10</sub>aryloxy group; R<sup>5</sup> represents a hydrogen atom or a C<sub>1</sub>-alkyl, C<sub>3</sub>-cycloalkyl or C<sub>6-10</sub>aryl group; and X is oxygen or sulfur; except that R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup>, R<sup>4</sup> and R<sup>5</sup> may not all be  
 10 hydrogen;

which method is characterized by forming an intermediate aryloxy- or arylthio-arylaldehydes or ketones by reacting a corresponding (thio)phenol with fluorobenzaldehyde or a fluoroaryl ketone in a solvent  
 15 in the presence of potassium carbonate at temperatures in the range of 100 to 200°C under a non-oxidizing gas, extracting the intermediate and then reacting the intermediate with semicarbazide and collecting the resulting precipitate of the desired compound.

20 12. A method of preparing a compound of general formula I:

- wherein: R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup> and R<sup>4</sup> may be the same or different and each represents a hydrogen or halogen atom, or a C<sub>1-10</sub>alkyl, C<sub>3-10</sub>cycloalkyl, cyano, C<sub>1-10</sub>alkoxy or C<sub>6-10</sub>aryloxy group; R<sup>5</sup> represents a hydrogen atom or a C<sub>1-10</sub>alkyl,  
 5 C<sub>3-10</sub>cycloalkyl or C<sub>6-10</sub>aryl group; and X is oxygen or sulfur; except that R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup>, R<sup>4</sup> and R<sup>5</sup> may not all be hydrogen;

which method is characterized in that intermediate aldehydes were prepared by adding benzoyl chloride or 4-chlorobenzoyl chloride to a solution of 4-hydroxybenzaldehyde in pyridine, pouring the reaction mixture onto acetic acid, collecting the precipitate and recrystallizing said precipitate to give 4-benzoyloxybenzaldehyde or 4-(4-chlorobenzoyloxy)benzaldehyde.

- 15 13. A method of treating a human or animal patient for a disorder of the central nervous system, characterized by administering to said patient an effective amount of a compound having the general formula I:

- 20 wherein: R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup> and R<sup>4</sup> may be the same or different and each represents a hydrogen or halogen atom, or a C<sub>1-10</sub>alkyl, C<sub>3-10</sub>cycloalkyl, cyano, C<sub>1-10</sub>alkoxy or C<sub>6-10</sub>aryloxy group; R<sup>5</sup> represents a hydrogen atom or a C<sub>1-10</sub>alkyl, C<sub>3-10</sub>cycloalkyl or C<sub>6-10</sub>aryl group; and X is oxygen or sulfur; or a pharmaceutically-acceptable salt thereof.

- 25 14. A method according to claim 12 characterized in that said disorder exhibits convulsions or seizures.

15. A method according to claim 12 characterized in that said disorder is a exhibits epileptic seizures.

- "A" document defining the general state of the art which is not considered to be of particular relevance
- "B" earlier document but published on or after the international filing date
- "L" document which may throw doubts on priority (claim(s) or reference to an earlier date) or which is of interest as an earlier citation or other special reason (as specified)
- "O" document referring to an oral disclosure, use, exhibition or other means
- "P" document published prior to the international filing date but later than the priority date claimed

- "T" later document published after the international filing date or prior art date and not in conflict with the application but contributing to understand the principle or theory underlying the invention
- "X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
- "Y" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.
- "Z" document member of the same patent family

# INTERNATIONAL SEARCH REPORT

International application No.

PCT/CA96/00380

**Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)**

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1.  Claims Nos.: because they relate to subject matter not required to be searched by this Authority, namely:  
Although claims 13-15 are directed to a method of treatment of the human body the search has been carried out completely and based on the alleged effects of the compounds/compositions.
2.  Claims Nos.: because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3.  Claims Nos.: because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

**Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)**

This International Searching Authority found multiple inventions in this international application, as follows:

1.  As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2.  As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3.  As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4.  No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

## Remark on Protest

- The additional search fees were accompanied by the applicant's protest.  
 No protest accompanied the payment of additional search fees.
